SATIN NICKEL CARE INSTRUCTIONS

This is achieved by taking a solid piece of brass and lightly brushing the surface until a soft, consistent grain is applied to the metal. A layer of nickel has then been applied and a second application of grain has been added to the metal. We have then applied a clear lacquer to give it a satin finish. This layer also prevents the nickel from tarnishing.

A lacquer coating is applied to protect the finish, but please ensure your electrician has clean, grease-free hands when handling the light.

The humid environment of a bathroom or kitchen will not affect the finish, but this is not approved for use outside.

To preserve the Satin nickel finish on your lights, please follow these instructions:

*Clean your product regularly with a damp cloth
for stubborn marks a pH-neutral liquid soap is all you need
Never use cleaning agents that contain abrasives*

Ask your electrician to take care when handling the products. Brass is a soft metal and will scratch easily. Grease, plaster, tile grout and other building materials may permanently damage your product. Whilst we endeavour to create products of the highest quality, the hand finished nature of the products means there may be small differences in the finishes of each piece. In the unlikely event your order arrives damaged or defective please contact us prior to installation.

If you have any questions or need spare parts please contact us with your order number, which is attached to your product.

We hope you are extremely happy with your product.
